Unittest for `state_machine`

June 16, 2020

Contents

1 Test Information

1.1 Test Candidate Information

This Module helps implementing state machines.

Library Information	
Name	state_machine
State	Released
Supported Interpreters	python2, python3
Version	76b84b090203dec573df45780af7375a
Dependencies	

1.2 Unittest Information

Unittest Information	
Version	88eb21720b062b30078e96dd6204ccdd
Testruns with	python 2.7.17 (final), python 3.6.9 (final)

1.3 Test System Information

System Information	
Architecture	64bit
Distribution	LinuxMint 19.3 tricia
Hostname	ahorn
Kernel	5.3.0-59-generic (#53 18.04.1-Ubuntu SMP Thu Jun 4 14:58:26 UTC 2020)
Machine	x86_64
Path	/user_data/data/dirk/prj/unittest/state_machine/unittest
System	Linux
Username	dirk

2 Statistic

2.1 Test-Statistic for testrun with python 2.7.17 (final)

Number of tests	**20**
Number of successfull tests	**20**
Number of possibly failed tests	**0**
Number of failed tests	**0**
Executionlevel	Full Test (all defined tests)
Time consumption	1.661s

2.2 Test-Statistic for testrun with python 3.6.9 (final)

Number of tests	**20**
Number of successfull tests	**20**
Number of possibly failed tests	**0**
Number of failed tests	**0**
Executionlevel	Full Test (all defined tests)
Time consumption	1.654s

2.3 Coverage Statistic

Module- or Filename	Line-Coverage	Branch-Coverage
state_machine	100.0%	100.0%
state_machine.__init__.py	100.0%	

3 Tested Requirements

3.1 Module Initialisation

3.1.1 Default State

Description
The state machine shall start in the state, given while module initialisation.

Reason for the implementation
Creation of a defined state after initialisation.

Fitcriterion
State machine is in the initial state after initialisation.

Testresult
This test was passed with the state: **Success**. See also full trace in section A.1.1!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (22)
Start-Time:	2020-06-16 22:45:42,191
Finished-Time:	2020-06-16 22:45:42,192
Time-Consumption	0.001s

Testsummary:

Info	Initialising the state machine with state_c
Success	State after initialisation is correct (Content 'state_c' and Type is <type 'str'>).

Testresult
This test was passed with the state: **Success**. See also full trace in section B.1.1!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (22)
Start-Time:	2020-06-16 22:45:44,274
Finished-Time:	2020-06-16 22:45:44,274
Time-Consumption	0.000s

Testsummary:

Info	Initialising the state machine with state_c
Success	State after initialisation is correct (Content 'state_c' and Type is <class 'str'>).

3.1.2 Default Last Transition Condtion

Description
The state machine shall return the string `__init__` for last transition condition after initalisation.

Reason for the implementation
Creation of a defined state after initialisation.

Fitcriterion
The last transition condition is __init__ after initialisation.

Testresult
This test was passed with the state: **Success**. See also full trace in section A.1.2!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (23)
Start-Time:	2020-06-16 22:45:42,192
Finished-Time:	2020-06-16 22:45:42,192
Time-Consumption	0.000s

Testsummary:

Info	Initialising the state machine with state_c
Success	Last transition condition after initialisation is correct (Content '__init__' and Type is <type 'str'>).

Testresult
This test was passed with the state: **Success**. See also full trace in section B.1.2!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (23)
Start-Time:	2020-06-16 22:45:44,274
Finished-Time:	2020-06-16 22:45:44,275
Time-Consumption	0.000s

Testsummary:

Info	Initialising the state machine with state_c
Success	Last transition condition after initialisation is correct (Content '__init__' and Type is <class 'str'>).

3.1.3 Default Previous State

Description
The state machine shall return None for previous state after initalisation.

Reason for the implementation
Creation of a defined state after initialisation.

Fitcriterion
The previous state is None after initialisation.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.3!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (24)
Start-Time:	2020-06-16 22:45:42,192
Finished-Time:	2020-06-16 22:45:42,192
Time-Consumption	0.000s

Testsummary:

Info	Initialising the state machine with state_c
Success	Last state after initialisation is correct (Content None and Type is <type 'NoneType'>).

Testresult

This test was passed with the state: **Success**. See also full trace in section B.1.3!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (24)
Start-Time:	2020-06-16 22:45:44,275
Finished-Time:	2020-06-16 22:45:44,275
Time-Consumption	0.000s

Testsummary:

Info	Initialising the state machine with state_c
Success	Last state after initialisation is correct (Content None and Type is <class 'NoneType'>).

3.1.4 Additional Keyword Arguments

Description

The state machine shall store all given keyword arguments as variables of the classes instance.

Reason for the implementation

Store further information (e.g. for calculation of the transition conditions).

Fitcriterion

At least two given keyword arguments with different types are available after initialisation.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.4!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (25)
Start-Time:	2020-06-16 22:45:42,193
Finished-Time:	2020-06-16 22:45:42,193
Time-Consumption	0.001s

Testsummary:	
Info	Initialising the state machine with state_c
Success	Keyword argument kw_arg_no_4 stored in state_machine is correct (Content {'1': 1, '2': 'two'} and Type is <type 'dict'>).
Success	Keyword argument kw_arg_no_1 stored in state_machine is correct (Content 1 and Type is <type 'int'>).
Success	Keyword argument kw_arg_no_3 stored in state_machine is correct (Content True and Type is <type 'bool'>).
Success	Keyword argument kw_arg_no_2 stored in state_machine is correct (Content '2' and Type is <type 'str'>).

Testresult

This test was passed with the state: Success. See also full trace in section B.1.4!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (25)
Start-Time:	2020-06-16 22:45:44,275
Finished-Time:	2020-06-16 22:45:44,276
Time-Consumption	0.001s

Testsummary:	
Info	Initialising the state machine with state_c
Success	Keyword argument kw_arg_no_1 stored in state_machine is correct (Content 1 and Type is <class 'int'>).
Success	Keyword argument kw_arg_no_2 stored in state_machine is correct (Content '2' and Type is <class 'str'>).
Success	Keyword argument kw_arg_no_3 stored in state_machine is correct (Content True and Type is <class 'bool'>).
Success	Keyword argument kw_arg_no_4 stored in state_machine is correct (Content {'1': 1, '2': 'two'} and Type is <class 'dict'>).

3.2 Transition Changes

3.2.1 Transitiondefinition and -flow

Description

The user shall be able to define multiple states and transitions for the state machine. A transition shall have a start state, a target state and a transition condition. The transition condition shall be a method, where the user is able to calculate the condition on demand.

Reason for the implementation

Definition of the transitions for a state machine.

Fitcriterion

The order of at least three state changes is correct.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.5!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (28)
Start-Time:	2020-06-16 22:45:42,193
Finished-Time:	2020-06-16 22:45:42,199
Time-Consumption	0.006s

Testsummary:

Info	Initialising state machine with state_a
Success	Initial state after Initialisation is correct (Content 'state_a' and Type is <type 'str'>).
Info	Work routine executed the 1st time to do the state change. Defined Transitions are: True→state_b (0.0s); False→state_c (0.0s)
Success	State after 1st execution of work method is correct (Content 'state_b' and Type is <type 'str'>).
Info	Work routine executed the 2nd time to do the state change. Defined Transitions are: False→state_a (0.0s); True→state_c (0.0s)
Success	State after 2nd execution of work method is correct (Content 'state_c' and Type is <type 'str'>).
Info	Work routine executed the 3rd time with no effect. No Transitions starting from state_c (dead end)
Success	State after 3rd execution of work method is correct (Content 'state_c' and Type is <type 'str'>).

Testresult

This test was passed with the state: **Success**. See also full trace in section B.1.5!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (28)
Start-Time:	2020-06-16 22:45:44,276
Finished-Time:	2020-06-16 22:45:44,277
Time-Consumption	0.001s

Testsummary:

Info	Initialising state machine with state_a
Success	Initial state after Initialisation is correct (Content 'state_a' and Type is <class 'str'>).
Info	Work routine executed the 1st time to do the state change. Defined Transitions are: True→state_b (0.0s); False→state_c (0.0s)
Success	State after 1st execution of work method is correct (Content 'state_b' and Type is <class 'str'>).
Info	Work routine executed the 2nd time to do the state change. Defined Transitions are: False→state_a (0.0s); True→state_c (0.0s)
Success	State after 2nd execution of work method is correct (Content 'state_c' and Type is <class 'str'>).
Info	Work routine executed the 3rd time with no effect. No Transitions starting from state_c (dead end)
Success	State after 3rd execution of work method is correct (Content 'state_c' and Type is <class 'str'>).

3.2.2 Transitiontiming

Description

The user shall be able to define for each transition a transition time. On change of the transition condition to `True`, the transition timer starts counting the time from 0.0s. After reaching the transition time, the transition gets active.

Reason for the implementation

Robustness of the state changes (e.g. Oscillating conditions shall be ignored).

Fitcriterion

The transition time and the restart of the transion timer by setting the transition condition to `False` and to `True` again results in the expected transition timing ($\pm$0.05s).

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.6!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (29)
Start-Time:	2020-06-16 22:45:42,200
Finished-Time:	2020-06-16 22:45:42,582
Time-Consumption	0.382s

Testsummary:

Info	Initialising state machine with state_a
Success	Initial state after Initialisation is correct (Content 'state_a' and Type is <type 'str'>).
Info	Waiting for 0.160s or state change
Success	State after 1st cycle is correct (Content 'state_b' and Type is <type 'str'>).
Success	Transition time after 1st cycle is correct (Content 0.1506669521331787 in [0.145 ... 0.155] and Type is <type 'float'>).
Info	Waiting for 0.235s or state change
Success	State after 2nd cycle is correct (Content 'state_c' and Type is <type 'str'>).
Success	Transition time after 2nd cycle is correct (Content 0.15042591094970703 in [0.145 ... 0.155] and Type is <type 'float'>).
Success	Previous state duration is correct (Content 0.22575688362121582 in [0.21999999999999997 ... 0.22999999999999998] and Type is <type 'float'>).

Testresult

This test was passed with the state: **Success**. See also full trace in section B.1.6!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (29)
Start-Time:	2020-06-16 22:45:44,277
Finished-Time:	2020-06-16 22:45:44,657
Time-Consumption	0.380s

Testsummary:

Info	Initialising state machine with state_a

Success	Initial state after Initialisation is correct (Content 'state_a' and Type is <class 'str'>).
Info	Waiting for 0.160s or state change
Success	State after 1st cycle is correct (Content 'state_b' and Type is <class 'str'>).
Success	Transition time after 1st cycle is correct (Content 0.15065431594848633 in [0.145 ... 0.155] and Type is <class 'float'>).
Info	Waiting for 0.235s or state change
Success	State after 2nd cycle is correct (Content 'state_c' and Type is <class 'str'>).
Success	Transition time after 2nd cycle is correct (Content 0.15040063858032227 in [0.145 ... 0.155] and Type is <class 'float'>).
Success	Previous state duration is correct (Content 0.22561168670654297 in [0.21999999999999997 ... 0.22999999999999998] and Type is <class 'float'>).

3.2.3 Transitionpriorisation

Description

The state machine shall use the first active transition. If multiple transition are active, the transition with the highest overlap time will be used.

Reason for the implementation

Compensate the weakness of the execution quantisation.

Fitcriterion

At least one transition with at least two active conditions results in the expected state change.

Testresult

This test was passed with the state: Success. See also full trace in section A.1.7!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (30)
Start-Time:	2020-06-16 22:45:42,582
Finished-Time:	2020-06-16 22:45:42,826
Time-Consumption	0.244s

Testsummary:

Info	Initialising state machine with state_a, a transition to state_b after 0.151s and a transition to state_c after 0.150s
Success	Initial state after Initialisation is correct (Content 'state_a' and Type is <type 'str'>).
Info	Waiting for 0.300s or state change
Success	State after 1st cycle is correct (Content 'state_c' and Type is <type 'str'>).

Testresult

This test was passed with the state: Success. See also full trace in section B.1.7!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (30)
Start-Time:	2020-06-16 22:45:44,657

Finished-Time:	2020-06-16 22:45:44,901
Time-Consumption	0.244s

Testsummary:

Info	Initialising state machine with state_a, a transition to state_b after 0.151s and a transition to state_c after 0.150s
Success	Initial state after Initialisation is correct (Content 'state_a' and Type is <class 'str'>).
Info	Waiting for 0.300s or state change
Success	State after 1st cycle is correct (Content 'state_c' and Type is <class 'str'>).

3.3 Module Interface

3.3.1 This State

Description

The Module shall have a method for getting the current state.

Reason for the implementation

Comfortable user interface.

Fitcriterion

At least one returend state fits to the expecation.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.8!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (33)
Start-Time:	2020-06-16 22:45:42,827
Finished-Time:	2020-06-16 22:45:42,828
Time-Consumption	0.001s

Testsummary:

Info	Initialising the state machine with state_c
Success	Returnvalue of this_state() is correct (Content 'state_c' and Type is <type 'str'>).

Testresult

This test was passed with the state: **Success**. See also full trace in section B.1.8!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (33)
Start-Time:	2020-06-16 22:45:44,902
Finished-Time:	2020-06-16 22:45:44,903
Time-Consumption	0.002s

Testsummary:

Info	Initialising the state machine with state_c
Success	Returnvalue of this_state() is correct (Content 'state_c' and Type is <class 'str'>).

3.3.2 This State is

Description

The Module shall have a method for checking if the given state is currently active.

Reason for the implementation

Comfortable user interface.

Fitcriterion

At least two calls with different return values fit to the expectation.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.9!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (34)
Start-Time:	2020-06-16 22:45:42,828
Finished-Time:	2020-06-16 22:45:42,830
Time-Consumption	0.001s

Testsummary:

Info	Initialising the state machine with state_c
Success	Returnvalue of this_state_is(state_c) is correct (Content True and Type is <type 'bool'>).
Success	Returnvalue of this_state_is(state_b) is correct (Content False and Type is <type 'bool'>).

Testresult

This test was passed with the state: **Success**. See also full trace in section B.1.9!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (34)
Start-Time:	2020-06-16 22:45:44,904
Finished-Time:	2020-06-16 22:45:44,906
Time-Consumption	0.002s

Testsummary:

Info	Initialising the state machine with state_c
Success	Returnvalue of this_state_is(state_c) is correct (Content True and Type is <class 'bool'>).
Success	Returnvalue of this_state_is(state_b) is correct (Content False and Type is <class 'bool'>).

3.3.3 This State Duration

Description
The Module shall have a method for getting the time since the last state change appears.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least one returned duration fits to the current state duration (± 0.05s).

Testresult
This test was passed with the state: **Success**. See also full trace in section A.1.10!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (35)
Start-Time:	2020-06-16 22:45:42,830
Finished-Time:	2020-06-16 22:45:43,082
Time-Consumption	0.252s
Testsummary:	
Info	Running state machine test sequence.
Success	Return Value of this_state_duration() is correct (Content 0.2510569095611572 in [0.2 ... 0.3] and Type is <type 'float'>).

Testresult
This test was passed with the state: **Success**. See also full trace in section B.1.10!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (35)
Start-Time:	2020-06-16 22:45:44,906
Finished-Time:	2020-06-16 22:45:45,158
Time-Consumption	0.252s
Testsummary:	
Info	Running state machine test sequence.
Success	Return Value of this_state_duration() is correct (Content 0.25090503692626953 in [0.2 ... 0.3] and Type is <class 'float'>).

3.3.4 Last Transition Condition

Description
The Module shall have a method for getting the last transition condition.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least one returned transition condition fits to the expectation.

Testresult
This test was passed with the state: **Success**. See also full trace in section A.1.11!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (36)
Start-Time:	2020-06-16 22:45:43,083
Finished-Time:	2020-06-16 22:45:43,084
Time-Consumption	0.001s

Testsummary:

Info	Running state machine test sequence.
Success	Returnvalue of last_transition_condition() is correct (Content 'condition_a' and Type is <type 'str'>).

Testresult
This test was passed with the state: **Success**. See also full trace in section B.1.11!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (36)
Start-Time:	2020-06-16 22:45:45,158
Finished-Time:	2020-06-16 22:45:45,160
Time-Consumption	0.001s

Testsummary:

Info	Running state machine test sequence.
Success	Returnvalue of last_transition_condition() is correct (Content 'condition_a' and Type is <class 'str'>).

3.3.5 Last Transition Condition was

Description
The Module shall have a method for checking if the given condition was the last transition condition.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least two calls with different return values fit to the expectation.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.12!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (37)
Start-Time:	2020-06-16 22:45:43,085
Finished-Time:	2020-06-16 22:45:43,087
Time-Consumption	0.002s

Testsummary:

Info	Running state machine test sequence.
Success	Returnvalue of last_transition_condition(condition_a) is correct (Content True and Type is <type 'bool'>).
Success	Returnvalue of last_transition_condition(condition_c) is correct (Content False and Type is <type 'bool'>).

Testresult

This test was passed with the state: **Success**. See also full trace in section B.1.12!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (37)
Start-Time:	2020-06-16 22:45:45,160
Finished-Time:	2020-06-16 22:45:45,161
Time-Consumption	0.001s

Testsummary:

Info	Running state machine test sequence.
Success	Returnvalue of last_transition_condition(condition_a) is correct (Content True and Type is <class 'bool'>).
Success	Returnvalue of last_transition_condition(condition_c) is correct (Content False and Type is <class 'bool'>).

3.3.6 Previous State

Description

The Module shall have a method for getting the previous state.

Reason for the implementation

Comfortable user interface.

Fitcriterion

At least one returend state fits to the expecation.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.13!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (38)
Start-Time:	2020-06-16 22:45:43,087
Finished-Time:	2020-06-16 22:45:43,088
Time-Consumption	0.001s

Testsummary:

Info	Running state machine test sequence.
Success	Returnvalue of previous_state() is correct (Content 'state_a' and Type is <type 'str'>).

Testresult

This test was passed with the state: **Success**. See also full trace in section B.1.13!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (38)
Start-Time:	2020-06-16 22:45:45,161
Finished-Time:	2020-06-16 22:45:45,162
Time-Consumption	0.001s

Testsummary:

Info	Running state machine test sequence.
Success	Returnvalue of previous_state() is correct (Content 'state_a' and Type is <class 'str'>).

3.3.7 Previous State was

Description

The Module shall have a method for checking if the given state was the previous state.

Reason for the implementation

Comfortable user interface.

Fitcriterion

At least two calls with different return values fit to the expectation.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.14!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (39)
Start-Time:	2020-06-16 22:45:43,089
Finished-Time:	2020-06-16 22:45:43,090
Time-Consumption	0.002s

Testsummary:

Info	Running state machine test sequence.
Success	Returnvalue of previous_state_was(state_a) is correct (Content True and Type is <type 'bool'>).

Success	Returnvalue of previous_state_was(state_b) is correct (Content False and Type is <type 'bool'>).

Testresult

This test was passed with the state: Success. See also full trace in section B.1.14!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (39)
Start-Time:	2020-06-16 22:45:45,162
Finished-Time:	2020-06-16 22:45:45,163
Time-Consumption	0.001s

Testsummary:

Info	Running state machine test sequence.
Success	Returnvalue of previous_state_was(state_a) is correct (Content True and Type is <class 'bool'>).
Success	Returnvalue of previous_state_was(state_b) is correct (Content False and Type is <class 'bool'>).

3.3.8 Previous State Duration

Description

The Module shall have a method for getting active time for the previous state.

Reason for the implementation

Comfortable user interface.

Fitcriterion

At least one returned duration fits to the previous state duration (± 0.05s).

Testresult

This test was passed with the state: Success. See also full trace in section A.1.15!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (40)
Start-Time:	2020-06-16 22:45:43,091
Finished-Time:	2020-06-16 22:45:43,843
Time-Consumption	0.752s

Testsummary:

Info	Running state machine test sequence.
Success	Return Value of previous_state_duration() is correct (Content 0.7512421607971191 in [0.7 ... 0.8] and Type is <type 'float'>).

Testresult

This test was passed with the state: Success. See also full trace in section B.1.15!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (40)
Start-Time:	2020-06-16 22:45:45,164
Finished-Time:	2020-06-16 22:45:45,916
Time-Consumption	0.752s

Testsummary:

Info	Running state machine test sequence.
Success	Return Value of previous_state_duration() is correct (Content 0.7513647079467773 in [0.7 ... 0.8] and Type is <class 'float'>).

3.4 Transition Callbacks

3.4.1 State change callback for a defined transition and targetstate

Description

The state machine shall call all registered methods in the same order like the registration with all user given arguments for a defined set of *transition_condition* and *target_state*.

Reason for the implementation

Triggering state change actions for a specific transition condition and targetstate.

Fitcriterion

Methods are called in the registration order after state change with all user given arguments for the defined transition condition and targetstate and at least for one other condition not.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.16!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (43)
Start-Time:	2020-06-16 22:45:43,843
Finished-Time:	2020-06-16 22:45:43,846
Time-Consumption	0.002s

Testsummary:

Info	Running state machine sequence and storing sequence number for each callback
Success	Execution of state machine callback (1) (state_b, condition_a) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.
Success	Execution of state machine callback (2) (state_b, condition_a) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

Testresult

This test was passed with the state: **Success**. See also full trace in section B.1.16!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (43)
Start-Time:	2020-06-16 22:45:45,916
Finished-Time:	2020-06-16 22:45:45,921
Time-Consumption	0.004s

Testsummary:

Info	Running state machine sequence and storing sequence number for each callback
Success	Execution of state machine callback (1) (state_b, condition_a) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.
Success	Execution of state machine callback (2) (state_b, condition_a) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

3.4.2 State change callback for a defined transition

Description

The state machine shall call all registered methods in the same order like the registration with all user given arguments for a defined *transition_condition* and all *target_states*.

Reason for the implementation

Triggering state change actions for a specific transition condition.

Fitcriterion

Methods are called in the registration order after state change with all user given arguments for the defined transition condition and at least for one other transition condition not.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.17!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (44)
Start-Time:	2020-06-16 22:45:43,846
Finished-Time:	2020-06-16 22:45:43,849
Time-Consumption	0.003s

Testsummary:

Info	Running state machine sequence and storing sequence number for each callback
Success	Execution of state machine callback (1) (all_transitions, condition_b) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.
Success	Execution of state machine callback (2) (all_transitions, condition_b) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

Testresult

This test was passed with the state: **Success**. See also full trace in section B.1.17!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (44)
Start-Time:	2020-06-16 22:45:45,921
Finished-Time:	2020-06-16 22:45:45,923
Time-Consumption	0.003s

Testsummary:

Info	Running state machine sequence and storing sequence number for each callback
Success	Execution of state machine callback (1) (all_transitions, condition_b) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.
Success	Execution of state machine callback (2) (all_transitions, condition_b) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

3.4.3 State change callback for a defined targetstate

Description

The state machine shall call all registered methods in the same order like the registration with all user given arguments for all *transition_conditions* and a defined *target_state*.

Reason for the implementation

Triggering state change actions for a specific targetstate.

Fitcriterion

Methods are called in the registration order after state change with the defined targetstate and at least for one other targetstate not.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.18!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (45)
Start-Time:	2020-06-16 22:45:43,849
Finished-Time:	2020-06-16 22:45:43,852
Time-Consumption	0.003s

Testsummary:

Info	Running state machine sequence and storing sequence number for each callback
Success	Execution of state machine callback (1) (state_b, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.
Success	Execution of state machine callback (2) (state_b, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

Testresult

This test was passed with the state: **Success**. See also full trace in section B.1.18!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (45)
Start-Time:	2020-06-16 22:45:45,924
Finished-Time:	2020-06-16 22:45:45,926
Time-Consumption	0.003s

Testsummary:

Info	Running state machine sequence and storing sequence number for each callback
Success	Execution of state machine callback (1) (state_b, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.
Success	Execution of state machine callback (2) (state_b, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

3.4.4 State change callback for all kind of state changes

Description

The state machine shall call all registered methods in the same order like the registration with all user given arguments for all transitions.

Reason for the implementation

Triggering state change actions for all transition conditions and targetstates.

Fitcriterion

Methods are called in the registration order after state change.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.19!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (46)
Start-Time:	2020-06-16 22:45:43,853
Finished-Time:	2020-06-16 22:45:43,857
Time-Consumption	0.004s

Testsummary:

Info	Running state machine sequence and storing sequence number for each callback
Success	Execution of state machine callback (1) (all_transitions, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.
Success	Execution of state machine callback (2) (all_transitions, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

Testresult

This test was passed with the state: **Success**. See also full trace in section B.1.19!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (46)
Start-Time:	2020-06-16 22:45:45,926
Finished-Time:	2020-06-16 22:45:45,930
Time-Consumption	0.004s

Testsummary:

Info	Running state machine sequence and storing sequence number for each callback
Success	Execution of state machine callback (1) (all_transitions, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.
Success	Execution of state machine callback (2) (all_transitions, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

3.4.5 Execution order of Callbacks

Description

The callbacks shall be executed in the same order as they had been registered.

Reason for the implementation

User shall have the control about the execution order.

Fitcriterion

A callback with specific targetstate and condition will be executed before a non specific callback if the specific one had been regestered first.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.20!

Testrun:	python 2.7.17 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (47)
Start-Time:	2020-06-16 22:45:43,857
Finished-Time:	2020-06-16 22:45:43,859
Time-Consumption	0.002s

Testsummary:

Success	Callback execution order: Values and number of submitted values is correct. See detailed log for more information.

Testresult

This test was passed with the state: **Success**. See also full trace in section B.1.20!

Testrun:	python 3.6.9 (final)
Caller:	/user_data/data/dirk/prj/unittest/state_machine/unittest/src/tests/__init__.py (47)
Start-Time:	2020-06-16 22:45:45,931
Finished-Time:	2020-06-16 22:45:45,932
Time-Consumption	0.002s

Testsummary:

Success	Callback execution order: Values and number of submitted values is correct. See detailed log for more information.

A Trace for testrun with python 2.7.17 (final)

A.1 Tests with status Info (20)

A.1.1 Default State

Description
The state machine shall start in the state, given while module initialisation.

Reason for the implementation
Creation of a defined state after initialisation.

Fitcriterion
State machine is in the initial state after initialisation.

Testresult
This test was passed with the state: **Success**.

Info	Initialising the state machine with state_c

```
StateMachine: State change ('__init__'): None -> 'state_c'
```

Success	State after initialisation is correct (Content 'state_c' and Type is <type 'str'>).

```
Result (State after initialisation): 'state_c' (<type 'str'>)
Expectation (State after initialisation): result = 'state_c' (<type 'str'>)
```

A.1.2 Default Last Transition Condtion

Description
The state machine shall return the string `__init__` for last transition condition after initalisation.

Reason for the implementation
Creation of a defined state after initialisation.

Fitcriterion
The last transition condition is `__init__` after initialisation.

Testresult
This test was passed with the state: **Success**.

Info	Initialising the state machine with state_c

```
StateMachine: State change ('__init__'): None -> 'state_c'
```

Success	Last transition condition after initialisation is correct (Content '__init__' and Type is <type 'str'>).

```
Result (Last transition condition after initialisation): '__init__' (<type 'str'>)
```

```
Expectation (Last transition condition after initialisation): result = '__init__' (<type
↪  'str'>)
```

A.1.3 Default Previous State

Description
The state machine shall return None for previous state after initalisation.

Reason for the implementation
Creation of a defined state after initialisation.

Fitcriterion
The previous state is None after initialisation.

Testresult
This test was passed with the state: **Success**.

Info	Initialising the state machine with state_c

```
StateMachine: State change ('__init__'): None -> 'state_c'
```

Success	Last state after initialisation is correct (Content None and Type is <type 'NoneType'>).

```
Result (Last state after initialisation): None (<type 'NoneType'>)
```

```
Expectation (Last state after initialisation): result = None (<type 'NoneType'>)
```

A.1.4 Additional Keyword Arguments

Description
The state machine shall store all given keyword arguments as variables of the classes instance.

Reason for the implementation
Store further information (e.g. for calculation of the transition conditions).

Fitcriterion
At least two given keyword arguments with different types are available after initialisation.

Testresult
This test was passed with the state: **Success**.

Info	Initialising the state machine with state_c

```
StateMachine: State change ('__init__'): None -> 'state_c'
```

Success	Keyword argument kw_arg_no_4 stored in state_machine is correct (Content {'1': 1, '2': 'two'} and Type is <type 'dict'>).

```
Result (Keyword argument kw_arg_no_4 stored in state_machine): { '1': 1, '2': 'two' } (<type
↪  'dict'>)
Expectation (Keyword argument kw_arg_no_4 stored in state_machine): result = { '1': 1, '2':
↪  'two' } (<type 'dict'>)
```

Success	Keyword argument kw_arg_no_1 stored in state_machine is correct (Content 1 and Type is <type 'int'>).

```
Result (Keyword argument kw_arg_no_1 stored in state_machine): 1 (<type 'int'>)
Expectation (Keyword argument kw_arg_no_1 stored in state_machine): result = 1 (<type 'int'>)
```

Success	Keyword argument kw_arg_no_3 stored in state_machine is correct (Content True and Type is <type 'bool'>).

```
Result (Keyword argument kw_arg_no_3 stored in state_machine): True (<type 'bool'>)
Expectation (Keyword argument kw_arg_no_3 stored in state_machine): result = True (<type
↪  'bool'>)
```

Success	Keyword argument kw_arg_no_2 stored in state_machine is correct (Content '2' and Type is <type 'str'>).

```
Result (Keyword argument kw_arg_no_2 stored in state_machine): '2' (<type 'str'>)
Expectation (Keyword argument kw_arg_no_2 stored in state_machine): result = '2' (<type
↪  'str'>)
```

A.1.5 Transitiondefinition and -flow

Description
The user shall be able to define multiple states and transitions for the state machine. A transition shall have a start state, a target state and a transition condition. The transition condition shall be a method, where the user is able to calculate the condition on demand.

Reason for the implementation
Definition of the transitions for a state machine.

Fitcriterion
The order of at least three state changes is correct.

Testresult
This test was passed with the state: **Success**.

Info	Initialising state machine with state_a

```
StateMachine: State change ('__init__'): None -> 'state_a'
```

Success	Initial state after Initialisation is correct (Content 'state_a' and Type is <type 'str'>).

```
Result (Initial state after Initialisation): 'state_a' (<type 'str'>)
Expectation (Initial state after Initialisation): result = 'state_a' (<type 'str'>)
```

Info	Work routine executed the 1st time to do the state change. Defined Transitions are: True→state_b (0.0s); False→state_c (0.0s)

```
StateMachine: State change ('condition_true'): 'state_a' -> 'state_b'
```

Success	State after 1st execution of work method is correct (Content 'state_b' and Type is <type 'str'>).

```
Result (State after 1st execution of work method): 'state_b' (<type 'str'>)
Expectation (State after 1st execution of work method): result = 'state_b' (<type 'str'>)
```

Info	Work routine executed the 2nd time to do the state change. Defined Transitions are: False→state_a (0.0s); True→state_c (0.0s)

```
StateMachine: State change ('condition_true'): 'state_b' -> 'state_c'
```

Success	State after 2nd execution of work method is correct (Content 'state_c' and Type is <type 'str'>).

```
Result (State after 2nd execution of work method): 'state_c' (<type 'str'>)
Expectation (State after 2nd execution of work method): result = 'state_c' (<type 'str'>)
```

Info	Work routine executed the 3rd time with no effect. No Transitions starting from state_c (dead end)

Success	State after 3rd execution of work method is correct (Content 'state_c' and Type is <type 'str'>).

```
Result (State after 3rd execution of work method): 'state_c' (<type 'str'>)
Expectation (State after 3rd execution of work method): result = 'state_c' (<type 'str'>)
```

A.1.6 Transitiontiming

Description
The user shall be able to define for each transition a transition time. On change of the transition condition to `True`, the transition timer starts counting the time from 0.0s. After reaching the transition time, the transition gets active.

Reason for the implementation

Robustness of the state changes (e.g. Oscillating conditions shall be ignored).

Fitcriterion

The transition time and the restart of the transion timer by setting the transition condition to `False` and to `True` again results in the expected transition timing (±0.05s).

Testresult

This test was passed with the state: **Success**.

Info	Initialising state machine with state_a

```
StateMachine: State change ('__init__'): None -> 'state_a'
```

Success	Initial state after Initialisation is correct (Content 'state_a' and Type is <type 'str'>).

```
Result (Initial state after Initialisation): 'state_a' (<type 'str'>)
Expectation (Initial state after Initialisation): result = 'state_a' (<type 'str'>)
```

Info	Waiting for 0.160s or state change

```
StateMachine: State change ('condition_true'): 'state_a' -> 'state_b'
```

Success	State after 1st cycle is correct (Content 'state_b' and Type is <type 'str'>).

```
Result (State after 1st cycle): 'state_b' (<type 'str'>)
Expectation (State after 1st cycle): result = 'state_b' (<type 'str'>)
```

Success	Transition time after 1st cycle is correct (Content 0.1506669521331787 in [0.145 ... 0.155] and Type is <type 'float'>).

```
Result (Transition time after 1st cycle): 0.1506669521331787 (<type 'float'>)
Expectation (Transition time after 1st cycle): 0.145 <= result <= 0.155
```

Info	Waiting for 0.235s or state change

```
StateMachine: State change ('condition_true'): 'state_b' -> 'state_c'
```

Success	State after 2nd cycle is correct (Content 'state_c' and Type is <type 'str'>).

```
Result (State after 2nd cycle): 'state_c' (<type 'str'>)
Expectation (State after 2nd cycle): result = 'state_c' (<type 'str'>)
```

Success	Transition time after 2nd cycle is correct (Content 0.15042591094970703 in [0.145 ... 0.155] and Type is <type 'float'>).

```
Result (Transition time after 2nd cycle): 0.15042591094970703 (<type 'float'>)
Expectation (Transition time after 2nd cycle): 0.145 <= result <= 0.155
```

Success	Previous state duration is correct (Content 0.22575688362121582 in [0.21999999999999997 ... 0.22999999999999998] and Type is <type 'float'>).

```
Result (Previous state duration): 0.22575688362121582 (<type 'float'>)
Expectation (Previous state duration): 0.21999999999999997 <= result <= 0.22999999999999998
```

A.1.7 Transitionpriorisation

Description

The state machine shall use the first active transition. If multiple transition are active, the transition with the highest overlap time will be used.

Reason for the implementation

Compensate the weakness of the execution quantisation.

Fitcriterion

At least one transition with at least two active conditions results in the expected state change.

Testresult

This test was passed with the state: **Success**.

Info	Initialising state machine with state_a, a transition to state_b after 0.151s and a transition to state_c after 0.150s

```
StateMachine: State change ('__init__'): None -> 'state_a'
```

Success	Initial state after Initialisation is correct (Content 'state_a' and Type is <type 'str'>).

```
Result (Initial state after Initialisation): 'state_a' (<type 'str'>)
Expectation (Initial state after Initialisation): result = 'state_a' (<type 'str'>)
```

Info	Waiting for 0.300s or state change

```
Executing method work after 0.000s
Executing method work after 0.060s
Executing method work after 0.121s
Executing method work after 0.181s
StateMachine: State change ('condition_true'): 'state_a' -> 'state_c'
```

Success	State after 1st cycle is correct (Content 'state_c' and Type is <type 'str'>).

```
Result (State after 1st cycle): 'state_c' (<type 'str'>)
Expectation (State after 1st cycle): result = 'state_c' (<type 'str'>)
```

A.1.8 This State

Description
The Module shall have a method for getting the current state.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least one returend state fits to the expecation.

Testresult
This test was passed with the state: **Success**.

Info	Initialising the state machine with state_c

```
StateMachine: State change ('__init__'): None -> 'state_c'
```

Success	Returnvalue of this_state() is correct (Content 'state_c' and Type is <type 'str'>).

```
Result (Returnvalue of this_state()): 'state_c' (<type 'str'>)
Expectation (Returnvalue of this_state()): result = 'state_c' (<type 'str'>)
```

A.1.9 This State is

Description
The Module shall have a method for checking if the given state is currently active.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least two calls with different return values fit to the expectation.

Testresult
This test was passed with the state: **Success**.

Info	Initialising the state machine with state_c

```
StateMachine: State change ('__init__'): None -> 'state_c'
```

Success	Returnvalue of this_state_is(state_c) is correct (Content True and Type is <type 'bool'>).

```
Result (Returnvalue of this_state_is(state_c)): True (<type 'bool'>)
Expectation (Returnvalue of this_state_is(state_c)): result = True (<type 'bool'>)
```

Success	Returnvalue of this_state_is(state_b) is correct (Content False and Type is <type 'bool'>).

```
Result (Returnvalue of this_state_is(state_b)): False (<type 'bool'>)
Expectation (Returnvalue of this_state_is(state_b)): result = False (<type 'bool'>)
```

A.1.10 This State Duration

Description

The Module shall have a method for getting the time since the last state change appears.

Reason for the implementation

Comfortable user interface.

Fitcriterion

At least one returned duration fits to the current state duration ($\pm$ 0.05s).

Testresult

This test was passed with the state: **Success**.

Info	Running state machine test sequence.

```
StateMachine: State change ('__init__'): None -> 'state_a'
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
Waiting for 0.25s
```

Success	Return Value of this_state_duration() is correct (Content 0.2510569095611572 in [0.2 ... 0.3] and Type is <type 'float'>).

```
Result (Return Value of this_state_duration()): 0.2510569095611572 (<type 'float'>)
Expectation (Return Value of this_state_duration()): 0.2 <= result <= 0.3
```

A.1.11 Last Transition Condition

Description

The Module shall have a method for getting the last transition condition.

Reason for the implementation

Comfortable user interface.

Fitcriterion

At least one returned transition condition fits to the expectation.

Testresult
This test was passed with the state: **Success**.

Info	Running state machine test sequence.

```
StateMachine: State change ('__init__'): None -> 'state_a'
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
```

Success	Returnvalue of last_transition_condition() is correct (Content 'condition_a' and Type is <type 'str'>).

```
Result (Returnvalue of last_transition_condition()): 'condition_a' (<type 'str'>)
Expectation (Returnvalue of last_transition_condition()): result = 'condition_a' (<type
↪  'str'>)
```

A.1.12 Last Transition Condition was

Description
The Module shall have a method for checking if the given condition was the last transition condition.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least two calls with different return values fit to the expectation.

Testresult
This test was passed with the state: **Success**.

Info	Running state machine test sequence.

```
StateMachine: State change ('__init__'): None -> 'state_a'
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
```

Success	Returnvalue of last_transition_condition(condition_a) is correct (Content True and Type is <type 'bool'>).

```
Result (Returnvalue of last_transition_condition(condition_a)): True (<type 'bool'>)
Expectation (Returnvalue of last_transition_condition(condition_a)): result = True (<type
↪  'bool'>)
```

Success	Returnvalue of last_transition_condition(condition_c) is correct (Content False and Type is <type 'bool'>).

```
Result (Returnvalue of last_transition_condition(condition_c)): False (<type 'bool'>)
Expectation (Returnvalue of last_transition_condition(condition_c)): result = False (<type
↪  'bool'>)
```

A.1.13 Previous State

Description
The Module shall have a method for getting the previous state.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least one returend state fits to the expecation.

Testresult
This test was passed with the state: **Success**.

Info	Running state machine test sequence.

```
StateMachine: State change ('__init__'): None -> 'state_a'
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
```

Success	Returnvalue of previous_state() is correct (Content 'state_a' and Type is <type 'str'>).

```
Result (Returnvalue of previous_state()): 'state_a' (<type 'str'>)
Expectation (Returnvalue of previous_state()): result = 'state_a' (<type 'str'>)
```

A.1.14 Previous State was

Description
The Module shall have a method for checking if the given state was the previous state.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least two calls with different return values fit to the expectation.

Testresult
This test was passed with the state: **Success**.

Info	Running state machine test sequence.

```
StateMachine: State change ('__init__'): None -> 'state_a'
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
```

Success	Returnvalue of previous_state_was(state_a) is correct (Content True and Type is <type 'bool'>).

```
Result (Returnvalue of previous_state_was(state_a)): True (<type 'bool'>)
Expectation (Returnvalue of previous_state_was(state_a)): result = True (<type 'bool'>)
```

Success	Returnvalue of previous_state_was(state_b) is correct (Content False and Type is <type 'bool'>).

```
Result (Returnvalue of previous_state_was(state_b)): False (<type 'bool'>)
Expectation (Returnvalue of previous_state_was(state_b)): result = False (<type 'bool'>)
```

A.1.15 Previous State Duration

Description
The Module shall have a method for getting active time for the previous state.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least one returned duration fits to the previous state duration (± 0.05s).

Testresult
This test was passed with the state: **Success**.

Info	Running state machine test sequence.

```
StateMachine: State change ('__init__'): None -> 'state_a'
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
Waiting for 0.75s
StateMachine: State change ('condition_b'): 'state_b' -> 'state_a'
```

Success	Return Value of previous_state_duration() is correct (Content 0.7512421607971191 in [0.7 ... 0.8] and Type is <type 'float'>).

```
Result (Return Value of previous_state_duration()): 0.7512421607971191 (<type 'float'>)
Expectation (Return Value of previous_state_duration()): 0.7 <= result <= 0.8
```

A.1.16 State change callback for a defined transition and targetstate

Description
The state machine shall call all registered methods in the same order like the registration with all user given arguments for a defined set of *transition_condition* and *target_state*.

Reason for the implementation
Triggering state change actions for a specific transition condition and targetstate.

Fitcriterion

Methods are called in the registration order after state change with all user given arguments for the defined transition condition and targetstate and at least for one other condition not.

Testresult

This test was passed with the state: **Success**.

Info	Running state machine sequence and storing sequence number for each callback

```
StateMachine: State change ('__init__'): None -> 'state_a'
Increasing sequence number to 1 caused by sequence progress
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 2 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 3 caused by callback_execution
Increasing sequence number to 4 caused by sequence progress
StateMachine: State change ('condition_b'): 'state_b' -> 'state_a'
Increasing sequence number to 5 caused by sequence progress
StateMachine: State change ('condition_b'): 'state_a' -> 'state_b'
Increasing sequence number to 6 caused by sequence progress
StateMachine: State change ('condition_c'): 'state_b' -> 'state_c'
```

Success	Execution of state machine callback (1) (state_b, condition_a) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

```
Result (Execution of state machine callback (1) (state_b, condition_a) identified by a
↪  sequence number): [ 1 ] (<type 'list'>)
Expectation (Execution of state machine callback (1) (state_b, condition_a) identified by a
↪  sequence number): result = [ 1 ] (<type 'list'>)
Result (Submitted value number 1): 1 (<type 'int'>)
Expectation (Submitted value number 1): result = 1 (<type 'int'>)
Submitted value number 1 is correct (Content 1 and Type is <type 'int'>).
```

Success	Execution of state machine callback (2) (state_b, condition_a) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

```
Result (Execution of state machine callback (2) (state_b, condition_a) identified by a
↪  sequence number): [ 2 ] (<type 'list'>)
Expectation (Execution of state machine callback (2) (state_b, condition_a) identified by a
↪  sequence number): result = [ 2 ] (<type 'list'>)
Result (Submitted value number 1): 2 (<type 'int'>)
Expectation (Submitted value number 1): result = 2 (<type 'int'>)
Submitted value number 1 is correct (Content 2 and Type is <type 'int'>).
```

A.1.17 State change callback for a defined transition

Description

The state machine shall call all registered methods in the same order like the registration with all user given arguments for a defined *transition_condition* and all *target_states*.

Reason for the implementation

Triggering state change actions for a specific transition condition.

Fitcriterion

Methods are called in the registration order after state change with all user given arguments for the defined transition condition and at least for one other transition condition not.

Testresult

This test was passed with the state: **Success**.

Info	Running state machine sequence and storing sequence number for each callback

```
StateMachine: State change ('__init__'): None -> 'state_a'
Increasing sequence number to 1 caused by sequence progress
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
Increasing sequence number to 2 caused by sequence progress
StateMachine: State change ('condition_b'): 'state_b' -> 'state_a'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 3 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 4 caused by callback_execution
Increasing sequence number to 5 caused by sequence progress
StateMachine: State change ('condition_b'): 'state_a' -> 'state_b'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 6 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 7 caused by callback_execution
Increasing sequence number to 8 caused by sequence progress
StateMachine: State change ('condition_c'): 'state_b' -> 'state_c'
```

Success	Execution of state machine callback (1) (all_transitions, condition_b) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

```
Result (Execution of state machine callback (1) (all_transitions, condition_b) identified by
↪  a sequence number): [ 2, 5 ] (<type 'list'>)
Expectation (Execution of state machine callback (1) (all_transitions, condition_b)
↪  identified by a sequence number): result = [ 2, 5 ] (<type 'list'>)
Result (Submitted value number 1): 2 (<type 'int'>)
Expectation (Submitted value number 1): result = 2 (<type 'int'>)
Submitted value number 1 is correct (Content 2 and Type is <type 'int'>).
Result (Submitted value number 2): 5 (<type 'int'>)
Expectation (Submitted value number 2): result = 5 (<type 'int'>)
Submitted value number 2 is correct (Content 5 and Type is <type 'int'>).
```

Success	Execution of state machine callback (2) (all_transitions, condition_b) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

```
Result (Execution of state machine callback (2) (all_transitions, condition_b) identified by
↪  a sequence number): [ 3, 6 ] (<type 'list'>)
Expectation (Execution of state machine callback (2) (all_transitions, condition_b)
↪  identified by a sequence number): result = [ 3, 6 ] (<type 'list'>)
Result (Submitted value number 1): 3 (<type 'int'>)
Expectation (Submitted value number 1): result = 3 (<type 'int'>)
Submitted value number 1 is correct (Content 3 and Type is <type 'int'>).
Result (Submitted value number 2): 6 (<type 'int'>)
Expectation (Submitted value number 2): result = 6 (<type 'int'>)
Submitted value number 2 is correct (Content 6 and Type is <type 'int'>).
```

A.1.18 State change callback for a defined targetstate

Description

The state machine shall call all registered methods in the same order like the registration with all user given arguments for all *transition_conditions* and a defined *target_state*.

Reason for the implementation

Triggering state change actions for a specific targetstate.

Fitcriterion

Methods are called in the registration order after state change with the defined targetstate and at least for one other targetstate not.

Testresult

This test was passed with the state: **Success**.

Info	Running state machine sequence and storing sequence number for each callback

```
StateMachine: State change ('__init__'): None -> 'state_a'
Increasing sequence number to 1 caused by sequence progress
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 2 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 3 caused by callback_execution
Increasing sequence number to 4 caused by sequence progress
StateMachine: State change ('condition_b'): 'state_b' -> 'state_a'
Increasing sequence number to 5 caused by sequence progress
StateMachine: State change ('condition_b'): 'state_a' -> 'state_b'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 6 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 7 caused by callback_execution
Increasing sequence number to 8 caused by sequence progress
StateMachine: State change ('condition_c'): 'state_b' -> 'state_c'
```

Success	Execution of state machine callback (1) (state_b, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

```
Result (Execution of state machine callback (1) (state_b, all_conditions) identified by a
↪  sequence number): [ 1, 5 ] (<type 'list'>)
Expectation (Execution of state machine callback (1) (state_b, all_conditions) identified by
↪  a sequence number): result = [ 1, 5 ] (<type 'list'>)
Result (Submitted value number 1): 1 (<type 'int'>)
Expectation (Submitted value number 1): result = 1 (<type 'int'>)
Submitted value number 1 is correct (Content 1 and Type is <type 'int'>).
Result (Submitted value number 2): 5 (<type 'int'>)
Expectation (Submitted value number 2): result = 5 (<type 'int'>)
Submitted value number 2 is correct (Content 5 and Type is <type 'int'>).
```

Success	Execution of state machine callback (2) (state_b, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

```
Result (Execution of state machine callback (2) (state_b, all_conditions) identified by a
↪  sequence number): [ 2, 6 ] (<type 'list'>)
Expectation (Execution of state machine callback (2) (state_b, all_conditions) identified by
↪  a sequence number): result = [ 2, 6 ] (<type 'list'>)
Result (Submitted value number 1): 2 (<type 'int'>)
Expectation (Submitted value number 1): result = 2 (<type 'int'>)
Submitted value number 1 is correct (Content 2 and Type is <type 'int'>).
Result (Submitted value number 2): 6 (<type 'int'>)
Expectation (Submitted value number 2): result = 6 (<type 'int'>)
Submitted value number 2 is correct (Content 6 and Type is <type 'int'>).
```

A.1.19 State change callback for all kind of state changes

Description

The state machine shall call all registered methods in the same order like the registration with all user given arguments for all transitions.

Reason for the implementation

Triggering state change actions for all transition conditions and targetstates.

Fitcriterion

Methods are called in the registration order after state change.

Testresult

This test was passed with the state: **Success**.

Info	Running state machine sequence and storing sequence number for each callback

```
StateMachine: State change ('__init__'): None -> 'state_a'
Increasing sequence number to 1 caused by sequence progress
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 2 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 3 caused by callback_execution
Increasing sequence number to 4 caused by sequence progress
StateMachine: State change ('condition_b'): 'state_b' -> 'state_a'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 5 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 6 caused by callback_execution
Increasing sequence number to 7 caused by sequence progress
StateMachine: State change ('condition_b'): 'state_a' -> 'state_b'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 8 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 9 caused by callback_execution
Increasing sequence number to 10 caused by sequence progress
StateMachine: State change ('condition_c'): 'state_b' -> 'state_c'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 11 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 12 caused by callback_execution
```

Success	Execution of state machine callback (1) (all_transitions, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

```
Result (Execution of state machine callback (1) (all_transitions, all_conditions) identified
↪  by a sequence number): [ 1, 4, 7, 10 ] (<type 'list'>)
Expectation (Execution of state machine callback (1) (all_transitions, all_conditions)
↪  identified by a sequence number): result = [ 1, 4, 7, 10 ] (<type 'list'>)
Result (Submitted value number 1): 1 (<type 'int'>)
Expectation (Submitted value number 1): result = 1 (<type 'int'>)
Submitted value number 1 is correct (Content 1 and Type is <type 'int'>).
Result (Submitted value number 2): 4 (<type 'int'>)
Expectation (Submitted value number 2): result = 4 (<type 'int'>)
Submitted value number 2 is correct (Content 4 and Type is <type 'int'>).
Result (Submitted value number 3): 7 (<type 'int'>)
Expectation (Submitted value number 3): result = 7 (<type 'int'>)
Submitted value number 3 is correct (Content 7 and Type is <type 'int'>).
Result (Submitted value number 4): 10 (<type 'int'>)
Expectation (Submitted value number 4): result = 10 (<type 'int'>)
Submitted value number 4 is correct (Content 10 and Type is <type 'int'>).
```

Success	Execution of state machine callback (2) (all_transitions, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

```
Result (Execution of state machine callback (2) (all_transitions, all_conditions) identified
↪  by a sequence number): [ 2, 5, 8, 11 ] (<type 'list'>)
Expectation (Execution of state machine callback (2) (all_transitions, all_conditions)
↪  identified by a sequence number): result = [ 2, 5, 8, 11 ] (<type 'list'>)
Result (Submitted value number 1): 2 (<type 'int'>)
Expectation (Submitted value number 1): result = 2 (<type 'int'>)
Submitted value number 1 is correct (Content 2 and Type is <type 'int'>).
Result (Submitted value number 2): 5 (<type 'int'>)
Expectation (Submitted value number 2): result = 5 (<type 'int'>)
Submitted value number 2 is correct (Content 5 and Type is <type 'int'>).
Result (Submitted value number 3): 8 (<type 'int'>)
Expectation (Submitted value number 3): result = 8 (<type 'int'>)
Submitted value number 3 is correct (Content 8 and Type is <type 'int'>).
Result (Submitted value number 4): 11 (<type 'int'>)
Expectation (Submitted value number 4): result = 11 (<type 'int'>)
Submitted value number 4 is correct (Content 11 and Type is <type 'int'>).
```

A.1.20 Execution order of Callbacks

Description

The callbacks shall be executed in the same order as they had been registered.

Reason for the implementation

User shall have the control about the execution order.

Fitcriterion

A callback with specific targetstate and condition will be executed before a non specific callback if the specific one had been regestered first.

Testresult

This test was passed with the state: **Success**.

Success	Callback execution order: Values and number of submitted values is correct. See detailed log for more information.

```
StateMachine: State change ('__init__'): None -> 'state_a'
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
Executing callback 0 - unittest.test.report_value
Executing callback 2 - unittest.test.report_value
StateMachine: State change ('condition_b'): 'state_b' -> 'state_a'
Executing callback 1 - unittest.test.report_value
Executing callback 2 - unittest.test.report_value
Result (Callback execution order): [ 'specific callback for reaching state_b', 'nonspecific
↪  callback', 'specific callback for reaching state_a', 'nonspecific callback' ] (<type
↪  'list'>)
Expectation (Callback execution order): result = [ 'specific callback for reaching state_b',
↪  'nonspecific callback', 'specific callback for reaching state_a', 'nonspecific callback'
↪  ] (<type 'list'>)
Result (Submitted value number 1): 'specific callback for reaching state_b' (<type 'str'>)
Expectation (Submitted value number 1): result = 'specific callback for reaching state_b'
↪  (<type 'str'>)
Submitted value number 1 is correct (Content 'specific callback for reaching state_b' and
↪  Type is <type 'str'>).
Result (Submitted value number 2): 'nonspecific callback' (<type 'str'>)
Expectation (Submitted value number 2): result = 'nonspecific callback' (<type 'str'>)
Submitted value number 2 is correct (Content 'nonspecific callback' and Type is <type 'str'>).
Result (Submitted value number 3): 'specific callback for reaching state_a' (<type 'str'>)
Expectation (Submitted value number 3): result = 'specific callback for reaching state_a'
↪  (<type 'str'>)
Submitted value number 3 is correct (Content 'specific callback for reaching state_a' and
↪  Type is <type 'str'>).
Result (Submitted value number 4): 'nonspecific callback' (<type 'str'>)
Expectation (Submitted value number 4): result = 'nonspecific callback' (<type 'str'>)
Submitted value number 4 is correct (Content 'nonspecific callback' and Type is <type 'str'>).
```

B Trace for testrun with python 3.6.9 (final)

B.1 Tests with status Info (20)

B.1.1 Default State

Description
The state machine shall start in the state, given while module initialisation.

Reason for the implementation
Creation of a defined state after initialisation.

Fitcriterion
State machine is in the initial state after initialisation.

Testresult
This test was passed with the state: **Success**.

Info	Initialising the state machine with state_c

```
StateMachine: State change ('__init__'): None -> 'state_c'
```

Success	State after initialisation is correct (Content 'state_c' and Type is <class 'str'>).

```
Result (State after initialisation): 'state_c' (<class 'str'>)
Expectation (State after initialisation): result = 'state_c' (<class 'str'>)
```

B.1.2 Default Last Transition Condtion

Description
The state machine shall return the string `__init__` for last transition condition after initalisation.

Reason for the implementation
Creation of a defined state after initialisation.

Fitcriterion
The last transition condition is `__init__` after initialisation.

Testresult
This test was passed with the state: **Success**.

Info	Initialising the state machine with state_c

```
StateMachine: State change ('__init__'): None -> 'state_c'
```

Success	Last transition condition after initialisation is correct (Content '__init__' and Type is <class 'str'>).

```
Result (Last transition condition after initialisation): '__init__' (<class 'str'>)
```

```
Expectation (Last transition condition after initialisation): result = '__init__' (<class
↪  'str'>)
```

B.1.3 Default Previous State

Description
The state machine shall return None for previous state after initalisation.

Reason for the implementation
Creation of a defined state after initialisation.

Fitcriterion
The previous state is None after initialisation.

Testresult
This test was passed with the state: **Success**.

Info	Initialising the state machine with state_c

```
StateMachine: State change ('__init__'): None -> 'state_c'
```

Success	Last state after initialisation is correct (Content None and Type is <class 'NoneType'>).

```
Result (Last state after initialisation): None (<class 'NoneType'>)
```

```
Expectation (Last state after initialisation): result = None (<class 'NoneType'>)
```

B.1.4 Additional Keyword Arguments

Description
The state machine shall store all given keyword arguments as variables of the classes instance.

Reason for the implementation
Store further information (e.g. for calculation of the transition conditions).

Fitcriterion
At least two given keyword arguments with different types are available after initialisation.

Testresult
This test was passed with the state: **Success**.

Info	Initialising the state machine with state_c

```
StateMachine: State change ('__init__'): None -> 'state_c'
```

Success	Keyword argument kw_arg_no_1 stored in state_machine is correct (Content 1 and Type is <class 'int'>).

```
Result (Keyword argument kw_arg_no_1 stored in state_machine): 1 (<class 'int'>)
Expectation (Keyword argument kw_arg_no_1 stored in state_machine): result = 1 (<class 'int'>)
```

Success	Keyword argument kw_arg_no_2 stored in state_machine is correct (Content '2' and Type is <class 'str'>).

```
Result (Keyword argument kw_arg_no_2 stored in state_machine): '2' (<class 'str'>)
Expectation (Keyword argument kw_arg_no_2 stored in state_machine): result = '2' (<class
↪  'str'>)
```

Success	Keyword argument kw_arg_no_3 stored in state_machine is correct (Content True and Type is <class 'bool'>).

```
Result (Keyword argument kw_arg_no_3 stored in state_machine): True (<class 'bool'>)
Expectation (Keyword argument kw_arg_no_3 stored in state_machine): result = True (<class
↪  'bool'>)
```

Success	Keyword argument kw_arg_no_4 stored in state_machine is correct (Content {'1': 1, '2': 'two'} and Type is <class 'dict'>).

```
Result (Keyword argument kw_arg_no_4 stored in state_machine): { '1': 1, '2': 'two' } (<class
↪  'dict'>)
Expectation (Keyword argument kw_arg_no_4 stored in state_machine): result = { '1': 1, '2':
↪  'two' } (<class 'dict'>)
```

B.1.5 Transitiondefinition and -flow

Description
The user shall be able to define multiple states and transitions for the state machine. A transition shall have a start state, a target state and a transition condition. The transition condition shall be a method, where the user is able to calculate the condition on demand.

Reason for the implementation
Definition of the transitions for a state machine.

Fitcriterion
The order of at least three state changes is correct.

Testresult
This test was passed with the state: **Success**.

Info	Initialising state machine with state_a

```
StateMachine: State change ('__init__'): None -> 'state_a'
```

Success	Initial state after Initialisation is correct (Content 'state_a' and Type is <class 'str'>).

```
Result (Initial state after Initialisation): 'state_a' (<class 'str'>)
Expectation (Initial state after Initialisation): result = 'state_a' (<class 'str'>)
```

Info	Work routine executed the 1st time to do the state change. Defined Transitions are: True→state_b (0.0s); False→state_c (0.0s)

```
StateMachine: State change ('condition_true'): 'state_a' -> 'state_b'
```

Success	State after 1st execution of work method is correct (Content 'state_b' and Type is <class 'str'>).

```
Result (State after 1st execution of work method): 'state_b' (<class 'str'>)
Expectation (State after 1st execution of work method): result = 'state_b' (<class 'str'>)
```

Info	Work routine executed the 2nd time to do the state change. Defined Transitions are: False→state_a (0.0s); True→state_c (0.0s)

```
StateMachine: State change ('condition_true'): 'state_b' -> 'state_c'
```

Success	State after 2nd execution of work method is correct (Content 'state_c' and Type is <class 'str'>).

```
Result (State after 2nd execution of work method): 'state_c' (<class 'str'>)
Expectation (State after 2nd execution of work method): result = 'state_c' (<class 'str'>)
```

Info	Work routine executed the 3rd time with no effect. No Transitions starting from state_c (dead end)

Success	State after 3rd execution of work method is correct (Content 'state_c' and Type is <class 'str'>).

```
Result (State after 3rd execution of work method): 'state_c' (<class 'str'>)
Expectation (State after 3rd execution of work method): result = 'state_c' (<class 'str'>)
```

B.1.6 Transitiontiming

Description
The user shall be able to define for each transition a transition time. On change of the transition condition to `True`, the transition timer starts counting the time from 0.0s. After reaching the transition time, the transition gets active.

Reason for the implementation

Robustness of the state changes (e.g. Oscillating conditions shall be ignored).

Fitcriterion

The transition time and the restart of the transion timer by setting the transition condition to `False` and to `True` again results in the expected transition timing (±0.05s).

Testresult

This test was passed with the state: **Success**.

Info	Initialising state machine with state_a

```
StateMachine: State change ('__init__'): None -> 'state_a'
```

Success	Initial state after Initialisation is correct (Content 'state_a' and Type is <class 'str'>).

```
Result (Initial state after Initialisation): 'state_a' (<class 'str'>)
Expectation (Initial state after Initialisation): result = 'state_a' (<class 'str'>)
```

```

B.1.7 Transitionpriorisation

Description

The state machine shall use the first active transition. If multiple transition are active, the transition with the highest overlap time will be used.

Reason for the implementation

Compensate the weakness of the execution quantisation.

Fitcriterion

At least one transition with at least two active conditions results in the expected state change.

Testresult

This test was passed with the state: **Success**.

Info	Initialising state machine with state_a, a transition to state_b after 0.151s and a transition to state_c after 0.150s

```
StateMachine: State change ('__init__'): None -> 'state_a'
```

Success	Initial state after Initialisation is correct (Content 'state_a' and Type is <class 'str'>).

```
Result (Initial state after Initialisation): 'state_a' (<class 'str'>)
Expectation (Initial state after Initialisation): result = 'state_a' (<class 'str'>)
```

Info	Waiting for 0.300s or state change

```
Executing method work after 0.000s
Executing method work after 0.060s
Executing method work after 0.121s
Executing method work after 0.181s
StateMachine: State change ('condition_true'): 'state_a' -> 'state_c'
```

Success	State after 1st cycle is correct (Content 'state_c' and Type is <class 'str'>).

```
Result (State after 1st cycle): 'state_c' (<class 'str'>)
Expectation (State after 1st cycle): result = 'state_c' (<class 'str'>)
```

B.1.8 This State

Description
The Module shall have a method for getting the current state.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least one returend state fits to the expecation.

Testresult
This test was passed with the state: **Success**.

Info	Initialising the state machine with state_c

```
StateMachine: State change ('__init__'): None -> 'state_c'
```

Success	Returnvalue of this_state() is correct (Content 'state_c' and Type is <class 'str'>).

```
Result (Returnvalue of this_state()): 'state_c' (<class 'str'>)
Expectation (Returnvalue of this_state()): result = 'state_c' (<class 'str'>)
```

B.1.9 This State is

Description
The Module shall have a method for checking if the given state is currently active.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least two calls with different return values fit to the expectation.

Testresult
This test was passed with the state: **Success**.

Info	Initialising the state machine with state_c

```
StateMachine: State change ('__init__'): None -> 'state_c'
```

Success	Returnvalue of this_state_is(state_c) is correct (Content True and Type is <class 'bool'>).

```
Result (Returnvalue of this_state_is(state_c)): True (<class 'bool'>)
Expectation (Returnvalue of this_state_is(state_c)): result = True (<class 'bool'>)
```

Success	Returnvalue of this_state_is(state_b) is correct (Content False and Type is <class 'bool'>).

```
Result (Returnvalue of this_state_is(state_b)): False (<class 'bool'>)
Expectation (Returnvalue of this_state_is(state_b)): result = False (<class 'bool'>)
```

B.1.10 This State Duration

Description

The Module shall have a method for getting the time since the last state change appears.

Reason for the implementation

Comfortable user interface.

Fitcriterion

At least one returned duration fits to the current state duration (± 0.05s).

Testresult

This test was passed with the state: **Success**.

Info	Running state machine test sequence.

```
StateMachine: State change ('__init__'): None -> 'state_a'
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
Waiting for 0.25s
```

Success	Return Value of this_state_duration() is correct (Content 0.25090503692626953 in [0.2 ... 0.3] and Type is <class 'float'>).

```
Result (Return Value of this_state_duration()): 0.25090503692626953 (<class 'float'>)
Expectation (Return Value of this_state_duration()): 0.2 <= result <= 0.3
```

B.1.11 Last Transition Condition

Description

The Module shall have a method for getting the last transition condition.

Reason for the implementation

Comfortable user interface.

Fitcriterion

At least one returned transition condition fits to the expectation.

Testresult
This test was passed with the state: **Success**.

Info	Running state machine test sequence.

```
StateMachine: State change ('__init__'): None -> 'state_a'
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
```

Success	Returnvalue of last_transition_condition() is correct (Content 'condition_a' and Type is <class 'str'>).

```
Result (Returnvalue of last_transition_condition()): 'condition_a' (<class 'str'>)
Expectation (Returnvalue of last_transition_condition()): result = 'condition_a' (<class
↪  'str'>)
```

B.1.12 Last Transition Condition was

Description
The Module shall have a method for checking if the given condition was the last transition condition.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least two calls with different return values fit to the expectation.

Testresult
This test was passed with the state: **Success**.

Info	Running state machine test sequence.

```
StateMachine: State change ('__init__'): None -> 'state_a'
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
```

Success	Returnvalue of last_transition_condition(condition_a) is correct (Content True and Type is <class 'bool'>).

```
Result (Returnvalue of last_transition_condition(condition_a)): True (<class 'bool'>)
Expectation (Returnvalue of last_transition_condition(condition_a)): result = True (<class
↪  'bool'>)
```

Success	Returnvalue of last_transition_condition(condition_c) is correct (Content False and Type is <class 'bool'>).

```
Result (Returnvalue of last_transition_condition(condition_c)): False (<class 'bool'>)
Expectation (Returnvalue of last_transition_condition(condition_c)): result = False (<class
↪  'bool'>)
```

B.1.13 Previous State

Description
The Module shall have a method for getting the previous state.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least one returend state fits to the expecation.

Testresult
This test was passed with the state: **Success**.

Info	Running state machine test sequence.

```
StateMachine: State change ('__init__'): None -> 'state_a'
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
```

Success	Returnvalue of previous_state() is correct (Content 'state_a' and Type is <class 'str'>).

```
Result (Returnvalue of previous_state()): 'state_a' (<class 'str'>)
Expectation (Returnvalue of previous_state()): result = 'state_a' (<class 'str'>)
```

B.1.14 Previous State was

Description
The Module shall have a method for checking if the given state was the previous state.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least two calls with different return values fit to the expectation.

Testresult
This test was passed with the state: **Success**.

Info	Running state machine test sequence.

```
StateMachine: State change ('__init__'): None -> 'state_a'
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
```

Success	Returnvalue of previous_state_was(state_a) is correct (Content True and Type is <class 'bool'>).

```
Result (Returnvalue of previous_state_was(state_a)): True (<class 'bool'>)
Expectation (Returnvalue of previous_state_was(state_a)): result = True (<class 'bool'>)
```

Success	Returnvalue of previous_state_was(state_b) is correct (Content False and Type is <class 'bool'>).

```
Result (Returnvalue of previous_state_was(state_b)): False (<class 'bool'>)
Expectation (Returnvalue of previous_state_was(state_b)): result = False (<class 'bool'>)
```

B.1.15 Previous State Duration

Description
The Module shall have a method for getting active time for the previous state.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least one returned duration fits to the previous state duration (± 0.05s).

Testresult
This test was passed with the state: **Success**.

Info	Running state machine test sequence.

```
StateMachine: State change ('__init__'): None -> 'state_a'
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
Waiting for 0.75s
StateMachine: State change ('condition_b'): 'state_b' -> 'state_a'
```

Success	Return Value of previous_state_duration() is correct (Content 0.7513647079467773 in [0.7 ... 0.8] and Type is <class 'float'>).

```
Result (Return Value of previous_state_duration()): 0.7513647079467773 (<class 'float'>)
Expectation (Return Value of previous_state_duration()): 0.7 <= result <= 0.8
```

B.1.16 State change callback for a defined transition and targetstate

Description
The state machine shall call all registered methods in the same order like the registration with all user given arguments for a defined set of *transition_condition* and *target_state*.

Reason for the implementation
Triggering state change actions for a specific transition condition and targetstate.

Fitcriterion

Methods are called in the registration order after state change with all user given arguments for the defined transition condition and targetstate and at least for one other condition not.

Testresult

This test was passed with the state: **Success**.

Info	Running state machine sequence and storing sequence number for each callback

```
StateMachine: State change ('__init__'): None -> 'state_a'
Increasing sequence number to 1 caused by sequence progress
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 2 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 3 caused by callback_execution
Increasing sequence number to 4 caused by sequence progress
StateMachine: State change ('condition_b'): 'state_b' -> 'state_a'
Increasing sequence number to 5 caused by sequence progress
StateMachine: State change ('condition_b'): 'state_a' -> 'state_b'
Increasing sequence number to 6 caused by sequence progress
StateMachine: State change ('condition_c'): 'state_b' -> 'state_c'
```

Success	Execution of state machine callback (1) (state_b, condition_a) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

```
Result (Execution of state machine callback (1) (state_b, condition_a) identified by a
↪  sequence number): [ 1 ] (<class 'list'>)
Expectation (Execution of state machine callback (1) (state_b, condition_a) identified by a
↪  sequence number): result = [ 1 ] (<class 'list'>)
Result (Submitted value number 1): 1 (<class 'int'>)
Expectation (Submitted value number 1): result = 1 (<class 'int'>)
Submitted value number 1 is correct (Content 1 and Type is <class 'int'>).
```

Success	Execution of state machine callback (2) (state_b, condition_a) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

```
Result (Execution of state machine callback (2) (state_b, condition_a) identified by a
↪  sequence number): [ 2 ] (<class 'list'>)
Expectation (Execution of state machine callback (2) (state_b, condition_a) identified by a
↪  sequence number): result = [ 2 ] (<class 'list'>)
Result (Submitted value number 1): 2 (<class 'int'>)
Expectation (Submitted value number 1): result = 2 (<class 'int'>)
Submitted value number 1 is correct (Content 2 and Type is <class 'int'>).
```

B.1.17 State change callback for a defined transition

Description

The state machine shall call all registered methods in the same order like the registration with all user given arguments for a defined *transition_condition* and all *target_states*.

Reason for the implementation

Triggering state change actions for a specific transition condition.

Fitcriterion

Methods are called in the registration order after state change with all user given arguments for the defined transition condition and at least for one other transition condition not.

Testresult

This test was passed with the state: **Success**.

Info	Running state machine sequence and storing sequence number for each callback

```
StateMachine: State change ('__init__'): None -> 'state_a'
Increasing sequence number to 1 caused by sequence progress
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
Increasing sequence number to 2 caused by sequence progress
StateMachine: State change ('condition_b'): 'state_b' -> 'state_a'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 3 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 4 caused by callback_execution
Increasing sequence number to 5 caused by sequence progress
StateMachine: State change ('condition_b'): 'state_a' -> 'state_b'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 6 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 7 caused by callback_execution
Increasing sequence number to 8 caused by sequence progress
StateMachine: State change ('condition_c'): 'state_b' -> 'state_c'
```

Success	Execution of state machine callback (1) (all_transitions, condition_b) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

```
Result (Execution of state machine callback (1) (all_transitions, condition_b) identified by
↪  a sequence number): [ 2, 5 ] (<class 'list'>)
Expectation (Execution of state machine callback (1) (all_transitions, condition_b)
↪  identified by a sequence number): result = [ 2, 5 ] (<class 'list'>)
Result (Submitted value number 1): 2 (<class 'int'>)
Expectation (Submitted value number 1): result = 2 (<class 'int'>)
Submitted value number 1 is correct (Content 2 and Type is <class 'int'>).
Result (Submitted value number 2): 5 (<class 'int'>)
Expectation (Submitted value number 2): result = 5 (<class 'int'>)
Submitted value number 2 is correct (Content 5 and Type is <class 'int'>).
```

Success	Execution of state machine callback (2) (all_transitions, condition_b) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

```
Result (Execution of state machine callback (2) (all_transitions, condition_b) identified by
↪  a sequence number): [ 3, 6 ] (<class 'list'>)
Expectation (Execution of state machine callback (2) (all_transitions, condition_b)
↪  identified by a sequence number): result = [ 3, 6 ] (<class 'list'>)
Result (Submitted value number 1): 3 (<class 'int'>)
Expectation (Submitted value number 1): result = 3 (<class 'int'>)
Submitted value number 1 is correct (Content 3 and Type is <class 'int'>).
Result (Submitted value number 2): 6 (<class 'int'>)
Expectation (Submitted value number 2): result = 6 (<class 'int'>)
Submitted value number 2 is correct (Content 6 and Type is <class 'int'>).
```

B.1.18 State change callback for a defined targetstate

Description

The state machine shall call all registered methods in the same order like the registration with all user given arguments for all *transition_conditions* and a defined *target_state*.

Reason for the implementation

Triggering state change actions for a specific targetstate.

Fitcriterion

Methods are called in the registration order after state change with the defined targetstate and at least for one other targetstate not.

Testresult

This test was passed with the state: **Success**.

Info	Running state machine sequence and storing sequence number for each callback

```
StateMachine: State change ('__init__'): None -> 'state_a'
Increasing sequence number to 1 caused by sequence progress
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 2 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 3 caused by callback_execution
Increasing sequence number to 4 caused by sequence progress
StateMachine: State change ('condition_b'): 'state_b' -> 'state_a'
Increasing sequence number to 5 caused by sequence progress
StateMachine: State change ('condition_b'): 'state_a' -> 'state_b'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 6 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 7 caused by callback_execution
Increasing sequence number to 8 caused by sequence progress
StateMachine: State change ('condition_c'): 'state_b' -> 'state_c'
```

Success	Execution of state machine callback (1) (state_b, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

```
Result (Execution of state machine callback (1) (state_b, all_conditions) identified by a
↪  sequence number): [ 1, 5 ] (<class 'list'>)
Expectation (Execution of state machine callback (1) (state_b, all_conditions) identified by
↪  a sequence number): result = [ 1, 5 ] (<class 'list'>)
Result (Submitted value number 1): 1 (<class 'int'>)
Expectation (Submitted value number 1): result = 1 (<class 'int'>)
Submitted value number 1 is correct (Content 1 and Type is <class 'int'>).
Result (Submitted value number 2): 5 (<class 'int'>)
Expectation (Submitted value number 2): result = 5 (<class 'int'>)
Submitted value number 2 is correct (Content 5 and Type is <class 'int'>).
```

Success	Execution of state machine callback (2) (state_b, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

```
Result (Execution of state machine callback (2) (state_b, all_conditions) identified by a

Result (Submitted value number 2): 6 (<class 'int'>)
Expectation (Submitted value number 2): result = 6 (<class 'int'>)
Submitted value number 2 is correct (Content 6 and Type is <class 'int'>).
```

B.1.19 State change callback for all kind of state changes

Description

The state machine shall call all registered methods in the same order like the registration with all user given arguments for all transitions.

Reason for the implementation

Triggering state change actions for all transition conditions and targetstates.

Fitcriterion

Methods are called in the registration order after state change.

Testresult

This test was passed with the state: **Success**.

Info	Running state machine sequence and storing sequence number for each callback

```
StateMachine: State change ('__init__'): None -> 'state_a'
Increasing sequence number to 1 caused by sequence progress
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 2 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 3 caused by callback_execution
Increasing sequence number to 4 caused by sequence progress
StateMachine: State change ('condition_b'): 'state_b' -> 'state_a'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 5 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 6 caused by callback_execution
Increasing sequence number to 7 caused by sequence progress
StateMachine: State change ('condition_b'): 'state_a' -> 'state_b'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 8 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 9 caused by callback_execution
Increasing sequence number to 10 caused by sequence progress
StateMachine: State change ('condition_c'): 'state_b' -> 'state_c'
Executing callback 0 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 11 caused by callback_execution
Executing callback 1 - tests.test_callbacks.exec_with_counter
Increasing sequence number to 12 caused by callback_execution
```

Success	Execution of state machine callback (1) (all_transitions, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

```
Result (Execution of state machine callback (1) (all_transitions, all_conditions) identified
↪  by a sequence number): [ 1, 4, 7, 10 ] (<class 'list'>)
Expectation (Execution of state machine callback (1) (all_transitions, all_conditions)
↪  identified by a sequence number): result = [ 1, 4, 7, 10 ] (<class 'list'>)
Result (Submitted value number 1): 1 (<class 'int'>)
Expectation (Submitted value number 1): result = 1 (<class 'int'>)

Submitted value number 1 is correct (Content 2 and Type is <class 'int'>).
Result (Submitted value number 2): 5 (<class 'int'>)
Expectation (Submitted value number 2): result = 5 (<class 'int'>)
Submitted value number 2 is correct (Content 5 and Type is <class 'int'>).
Result (Submitted value number 3): 8 (<class 'int'>)
Expectation (Submitted value number 3): result = 8 (<class 'int'>)
Submitted value number 3 is correct (Content 8 and Type is <class 'int'>).
Result (Submitted value number 4): 11 (<class 'int'>)
Expectation (Submitted value number 4): result = 11 (<class 'int'>)
Submitted value number 4 is correct (Content 11 and Type is <class 'int'>).
```

B.1.20 Execution order of Callbacks

Description

The callbacks shall be executed in the same order as they had been registered.

Reason for the implementation

User shall have the control about the execution order.

Fitcriterion

A callback with specific targetstate and condition will be executed before a non specific callback if the specific one had been regestered first.

Testresult

This test was passed with the state: **Success**.

Success	Callback execution order: Values and number of submitted values is correct. See detailed log for more information.

```
StateMachine: State change ('__init__'): None -> 'state_a'
StateMachine: State change ('condition_a'): 'state_a' -> 'state_b'
Executing callback 0 - unittest.test.report_value
Executing callback 2 - unittest.test.report_value
StateMachine: State change ('condition_b'): 'state_b' -> 'state_a'
Executing callback 1 - unittest.test.report_value
Executing callback 2 - unittest.test.report_value
Result (Callback execution order): [ 'specific callback for reaching state_b', 'nonspecific
↪  callback', 'specific callback for reaching state_a', 'nonspecific callback' ] (<class
↪  'list'>)
Expectation (Callback execution order): result = [ 'specific callback for reaching state_b',
↪  'nonspecific callback', 'specific callback for reaching state_a', 'nonspecific callback'
↪  ] (<class 'list'>)
Result (Submitted value number 1): 'specific callback for reaching state_b' (<class 'str'>)
Expectation (Submitted value number 1): result = 'specific callback for reaching state_b'
↪  (<class 'str'>)
Submitted value number 1 is correct (Content 'specific callback for reaching state_b' and
↪  Type is <class 'str'>).
Result (Submitted value number 2): 'nonspecific callback' (<class 'str'>)
Expectation (Submitted value number 2): result = 'nonspecific callback' (<class 'str'>)
Submitted value number 2 is correct (Content 'nonspecific callback' and Type is <class
↪  'str'>).
Result (Submitted value number 3): 'specific callback for reaching state_a' (<class 'str'>)
Expectation (Submitted value number 3): result = 'specific callback for reaching state_a'
↪  (<class 'str'>)
Submitted value number 3 is correct (Content 'specific callback for reaching state_a' and
↪  Type is <class 'str'>).
Result (Submitted value number 4): 'nonspecific callback' (<class 'str'>)
Expectation (Submitted value number 4): result = 'nonspecific callback' (<class 'str'>)
Submitted value number 4 is correct (Content 'nonspecific callback' and Type is <class
↪  'str'>).
```

state_machine (State Machine)
=============================

**Author:**

* Dirk Alders <sudo-dirk@mount-mockery.de>

**Description:**

    This Module helps implementing state machines.

**Submodules:**

* :class:`state_machine.state_machine`

**Unittest:**

    See also the :download:`unittest <state_machine/_testresults_/unittest.pdf>` documentation.

**Module Documentation:**

"""

__DESCRIPTION__ = """This Module helps implementing state machines."""
"""The Module description"""

class state_machine(object):
```

```
44      """
45      :param default_state: The default state which is set on initialisation.
46      :param log_lvl: The log level, this Module logs to (see Loging-Levels of Module :mod:`logging
        `)
47
48      .. note:: Additional keyword parameters well be stored as varibles of the instance (e.g. to
        give variables or methods for transition condition calculation).
49
50      A state machine class can be created by deriving it from this class. The transitions are
        defined by overriding the variable `TRANSITIONS`.
51      This Variable is a dictionary, where the key is the start-state and the content is a tuple or
         list of transitions. Each transition is a tuple or list
52      including the following information: (condition-method (str), transition-time (number),
        target_state (str)).
53
54      .. note:: The condition-method needs to be implemented as part of the new class.
55
56      .. note:: It is usefull to define the states as variables of this class.
57
58
59      **Example:**
60
61      .. literalinclude:: ../examples/example.py
62
63      .. literalinclude:: ../examples/example.log
64      """
65      TRANSITIONS = {}
66      LOG_PREFIX = 'StateMachine:'
67
68      def __init__(self, default_state, log_lvl, **kwargs):
69          self.__state__ = None
70          self.__last_transition_condition__ = None
71          self.__conditions_start_time__ = {}
72          self.__state_change_callbacks__ = {}
