Unittest for `state_machine`

March 23, 2025

Contents

1 Test Information

1.1 Test Candidate Information

This Module helps implementing state machines.

Library Information	
Name	state_machine
State	Released
Supported Interpreters	python3
Version	f41932a9f577e5485b47049c17da104d
Dependencies	

1.2 Unittest Information

Unittest Information	
Version	e6f5e3b6cb9ae84eee10254379ddd104
Testruns with	python 3.11.2 (final)

1.3 Test System Information

System Information	
Architecture	64bit
Distribution	Debian GNU/Linux 12 bookworm
Hostname	ahorn
Kernel	6.1.0-17-amd64 (#1 SMP PREEMPT_DYNAMIC Debian 6.1.69-1 (2023-12-30))
Machine	x86_64
Path	/home/dirk/my_repositories/unittest/state_machine
System	Linux
Username	dirk

2 Statistic

2.1 Test-Statistic for testrun with python 3.11.2 (final)

Number of tests	**20**
Number of successfull tests	**20**
Number of possibly failed tests	**0**
Number of failed tests	**0**
Executionlevel	Full Test (all defined tests)
Time consumption	1.668s

2.2 Coverage Statistic

Module- or Filename	Line-Coverage	Branch-Coverage
state_machine	100.0%	100.0%
state_machine.__init__.py	100.0%	

3 Tested Requirements

3.1 Module Initialisation

3.1.1 Default State

Description
The state machine shall start in the state, given while module initialisation.

Reason for the implementation
Creation of a defined state after initialisation.

Fitcriterion
State machine is in the initial state after initialisation.

Testresult
This test was passed with the state: **Success**. See also full trace in section A.1.1!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:28,296
Finished-Time:	2025-03-23 14:39:28,296
Time-Consumption	0.000s

Testsummary:

Info	Initialising the state machine with state_c
Success	State after initialisation is correct (Content 'state_c' and Type is <class 'str'>).

3.1.2 Default Last Transition Condtion

Description
The state machine shall return the string `__init__` for last transition condition after initalisation.

Reason for the implementation
Creation of a defined state after initialisation.

Fitcriterion
The last transition condition is `__init__` after initialisation.

Testresult
This test was passed with the state: **Success**. See also full trace in section A.1.2!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)

Start-Time:	2025-03-23 14:39:28,296
Finished-Time:	2025-03-23 14:39:28,297
Time-Consumption	0.000s

Testsummary:	
Info	Initialising the state machine with state_c
Success	Last transition condition after initialisation is correct (Content '__init__' and Type is <class 'str'>).

3.1.3 Default Previous State

Description

The state machine shall return `None` for previous state after initalisation.

Reason for the implementation

Creation of a defined state after initialisation.

Fitcriterion

The previous state is `None` after initialisation.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.3!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:28,297
Finished-Time:	2025-03-23 14:39:28,297
Time-Consumption	0.000s

Testsummary:	
Info	Initialising the state machine with state_c
Success	Last state after initialisation is correct (Content None and Type is <class 'NoneType'>).

3.1.4 Additional Keyword Arguments

Description

The state machine shall store all given keyword arguments as variables of the classes instance.

Reason for the implementation

Store further information (e.g. for calculation of the transition conditions).

Fitcriterion

At least two given keyword arguments with different types are available after initialisation.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.4!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:28,297
Finished-Time:	2025-03-23 14:39:28,297
Time-Consumption	0.001s

Testsummary:

Info	Initialising the state machine with state_c
Success	Keyword argument kw_arg_no_1 stored in state_machine is correct (Content 1 and Type is <class 'int'>).
Success	Keyword argument kw_arg_no_2 stored in state_machine is correct (Content '2' and Type is <class 'str'>).
Success	Keyword argument kw_arg_no_3 stored in state_machine is correct (Content True and Type is <class 'bool'>).
Success	Keyword argument kw_arg_no_4 stored in state_machine is correct (Content {'1': 1, '2': 'two'} and Type is <class 'dict'>).

3.2 Transition Changes

3.2.1 Transitiondefinition and -flow

Description

The user shall be able to define multiple states and transitions for the state machine. A transition shall have a start state, a target state and a transition condition. The transition condition shall be a method, where the user is able to calculate the condition on demand.

Reason for the implementation

Definition of the transitions for a state machine.

Fitcriterion

The order of at least three state changes is correct.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.5!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:28,298
Finished-Time:	2025-03-23 14:39:28,298
Time-Consumption	0.001s

Testsummary:

Info	Initialising state machine with state_a
Success	Initial state after Initialisation is correct (Content 'state_a' and Type is <class 'str'>).

Info	Work routine executed the 1st time to do the state change. Defined Transitions are: True→state_b (0.0s); False→state_c (0.0s)
Success	State after 1st execution of work method is correct (Content 'state_b' and Type is <class 'str'>).
Info	Work routine executed the 2nd time to do the state change. Defined Transitions are: False→state_a (0.0s); True→state_c (0.0s)
Success	State after 2nd execution of work method is correct (Content 'state_c' and Type is <class 'str'>).
Info	Work routine executed the 3rd time with no effect. No Transitions starting from state_c (dead end)
Success	State after 3rd execution of work method is correct (Content 'state_c' and Type is <class 'str'>).

3.2.2 Transitiontiming

Description

The user shall be able to define for each transition a transition time. On change of the transition condition to `True`, the transition timer starts counting the time from 0.0s. After reaching the transition time, the transition gets active.

Reason for the implementation

Robustness of the state changes (e.g. Oscillating conditions shall be ignored).

Fitcriterion

The transition time and the restart of the transion timer by setting the transition condition to `False` and to `True` again results in the expected transition timing (±0.05s).

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.6!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:28,298
Finished-Time:	2025-03-23 14:39:28,675
Time-Consumption	0.377s

Testsummary:

Info	Initialising state machine with state_a
Success	Initial state after Initialisation is correct (Content 'state_a' and Type is <class 'str'>).
Info	Waiting for 0.160s or state change
Success	State after 1st cycle is correct (Content 'state_b' and Type is <class 'str'>).
Success	Transition time after 1st cycle is correct (Content 0.15043091773986816 in [0.145 ... 0.155] and Type is <class 'float'>).
Info	Waiting for 0.235s or state change
Success	State after 2nd cycle is correct (Content 'state_c' and Type is <class 'str'>).
Success	Transition time after 2nd cycle is correct (Content 0.1502208709716797 in [0.145 ... 0.155] and Type is <class 'float'>).
Success	Previous state duration is correct (Content 0.22549748420715332 in [0.21999999999999997 ... 0.22999999999999998] and Type is <class 'float'>).

3.2.3 Transitionpriorisation

Description
The state machine shall use the first active transition. If multiple transition are active, the transition with the highest overlap time will be used.

Reason for the implementation
Compensate the weakness of the execution quantisation.

Fitcriterion
At least one transition with at least two active conditions results in the expected state change.

Testresult
This test was passed with the state: **Success**. See also full trace in section A.1.7!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:28,676
Finished-Time:	2025-03-23 14:39:28,920
Time-Consumption	0.244s

Testsummary:

Info	Initialising state machine with state_a, a transition to state_b after 0.151s and a transition to state_c after 0.150s
Success	Initial state after Initialisation is correct (Content 'state_a' and Type is <class 'str'>).
Info	Waiting for 0.300s or state change
Success	State after 1st cycle is correct (Content 'state_c' and Type is <class 'str'>).

3.3 Module Interface

3.3.1 This State

Description
The Module shall have a method for getting the current state.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least one returend state fits to the expecation.

Testresult
This test was passed with the state: **Success**. See also full trace in section A.1.8!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:28,921
Finished-Time:	2025-03-23 14:39:28,922
Time-Consumption	0.001s

Testsummary:

Info	Initialising the state machine with state_c
Success	Returnvalue of this_state() is correct (Content 'state_c' and Type is <class 'str'>).

3.3.2 This State is

Description
The Module shall have a method for checking if the given state is currently active.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least two calls with different return values fit to the expectation.

Testresult
This test was passed with the state: **Success**. See also full trace in section A.1.9!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:28,922
Finished-Time:	2025-03-23 14:39:28,924
Time-Consumption	0.002s

Testsummary:

Info	Initialising the state machine with state_c
Success	Returnvalue of this_state_is(state_c) is correct (Content True and Type is <class 'bool'>).
Success	Returnvalue of this_state_is(state_b) is correct (Content False and Type is <class 'bool'>).

3.3.3 This State Duration

Description
The Module shall have a method for getting the time since the last state change appears.

Reason for the implementation
Comfortable user interface.

Fitcriterion

At least one returned duration fits to the current state duration (± 0.05s).

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.10!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:28,924
Finished-Time:	2025-03-23 14:39:29,176
Time-Consumption	0.252s

Testsummary:

Info	Running state machine test sequence.
Success	Return Value of this_state_duration() is correct (Content 0.25109267234802246 in [0.2 ... 0.3] and Type is <class 'float'>).

3.3.4 Last Transition Condition

Description

The Module shall have a method for getting the last transition condition.

Reason for the implementation

Comfortable user interface.

Fitcriterion

At least one returned transition condition fits to the expectation.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.11!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:29,177
Finished-Time:	2025-03-23 14:39:29,179
Time-Consumption	0.002s

Testsummary:

Info	Running state machine test sequence.
Success	Returnvalue of last_transition_condition() is correct (Content 'condition_a' and Type is <class 'str'>).

3.3.5 Last Transition Condition was

Description
The Module shall have a method for checking if the given condition was the last transition condition.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least two calls with different return values fit to the expectation.

Testresult
This test was passed with the state: **Success**. See also full trace in section A.1.12!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:29,180
Finished-Time:	2025-03-23 14:39:29,182
Time-Consumption	0.002s

Testsummary:

Info	Running state machine test sequence.
Success	Returnvalue of last_transition_condition(condition_a) is correct (Content True and Type is <class 'bool'>).
Success	Returnvalue of last_transition_condition(condition_c) is correct (Content False and Type is <class 'bool'>).

3.3.6 Previous State

Description
The Module shall have a method for getting the previous state.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least one returend state fits to the expecation.

Testresult
This test was passed with the state: **Success**. See also full trace in section A.1.13!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:29,182

Finished-Time:	2025-03-23 14:39:29,183
Time-Consumption	0.001s

Testsummary:	
Info	Running state machine test sequence.
Success	Returnvalue of previous_state() is correct (Content 'state_a' and Type is <class 'str'>).

3.3.7 Previous State was

Description
The Module shall have a method for checking if the given state was the previous state.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least two calls with different return values fit to the expectation.

Testresult
This test was passed with the state: **Success**. See also full trace in section A.1.14!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:29,184
Finished-Time:	2025-03-23 14:39:29,186
Time-Consumption	0.002s

Testsummary:	
Info	Running state machine test sequence.
Success	Returnvalue of previous_state_was(state_a) is correct (Content True and Type is <class 'bool'>).
Success	Returnvalue of previous_state_was(state_b) is correct (Content False and Type is <class 'bool'>).

3.3.8 Previous State Duration

Description
The Module shall have a method for getting active time for the previous state.

Reason for the implementation
Comfortable user interface.

Fitcriterion
At least one returned duration fits to the previous state duration (± 0.05s).

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.15!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:29,186
Finished-Time:	2025-03-23 14:39:29,939
Time-Consumption	0.752s

Testsummary:

Info	Running state machine test sequence.
Success	Return Value of previous_state_duration() is correct (Content 0.7509410381317139 in [0.7 ... 0.8] and Type is <class 'float'>).

3.4 Transition Callbacks

3.4.1 State change callback for a defined transition and targetstate

Description

The state machine shall call all registered methods in the same order like the registration with all user given arguments for a defined set of *transition_condition* and *target_state*.

Reason for the implementation

Triggering state change actions for a specific transition condition and targetstate.

Fitcriterion

Methods are called in the registration order after state change with all user given arguments for the defined transition condition and targetstate and at least for one other condition not.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.16!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:29,939
Finished-Time:	2025-03-23 14:39:29,945
Time-Consumption	0.006s

Testsummary:

Info	Running state machine sequence and storing sequence number for each callback
Success	Execution of state machine callback (1) (state_b, condition_a) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.
Success	Execution of state machine callback (2) (state_b, condition_a) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

3.4.2 State change callback for a defined transition

Description

The state machine shall call all registered methods in the same order like the registration with all user given arguments for a defined *transition_condition* and all *target_states*.

Reason for the implementation

Triggering state change actions for a specific transition condition.

Fitcriterion

Methods are called in the registration order after state change with all user given arguments for the defined transition condition and at least for one other transition condition not.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.17!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:29,945
Finished-Time:	2025-03-23 14:39:29,952
Time-Consumption	0.006s

Testsummary:

Info	Running state machine sequence and storing sequence number for each callback
Success	Execution of state machine callback (1) (all_transitions, condition_b) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.
Success	Execution of state machine callback (2) (all_transitions, condition_b) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

3.4.3 State change callback for a defined targetstate

Description

The state machine shall call all registered methods in the same order like the registration with all user given arguments for all *transition_conditions* and a defined *target_state*.

Reason for the implementation

Triggering state change actions for a specific targetstate.

Fitcriterion

Methods are called in the registration order after state change with the defined targetstate and at least for one other targetstate not.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.18!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:29,952
Finished-Time:	2025-03-23 14:39:29,959
Time-Consumption	0.006s

Testsummary:

Info	Running state machine sequence and storing sequence number for each callback
Success	Execution of state machine callback (1) (state_b, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.
Success	Execution of state machine callback (2) (state_b, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

3.4.4 State change callback for all kind of state changes

Description

The state machine shall call all registered methods in the same order like the registration with all user given arguments for all transitions.

Reason for the implementation

Triggering state change actions for all transition conditions and targetstates.

Fitcriterion

Methods are called in the registration order after state change.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.19!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:29,959
Finished-Time:	2025-03-23 14:39:29,969
Time-Consumption	0.009s

Testsummary:

Info	Running state machine sequence and storing sequence number for each callback
Success	Execution of state machine callback (1) (all_transitions, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.
Success	Execution of state machine callback (2) (all_transitions, all_conditions) identified by a sequence number: Values and number of submitted values is correct. See detailed log for more information.

3.4.5 Execution order of Callbacks

Description

The callbacks shall be executed in the same order as they had been registered.

Reason for the implementation

User shall have the control about the execution order.

Fitcriterion

A callback with specific targetstate and condition will be executed before a non specific callback if the specific one had been regestered first.

Testresult

This test was passed with the state: **Success**. See also full trace in section A.1.20!

Testrun:	python 3.11.2 (final)
Caller:	/home/dirk/my_repositories/unittest/state_machine/unittest/src/report/__init__.py (323)
Start-Time:	2025-03-23 14:39:29,969
Finished-Time:	2025-03-23 14:39:29,971
Time-Consumption	0.002s

Testsummary:	
Success	Callback execution order: Values and number of submitted values is correct. See detailed log for more information.

42  __DESCRIPTION__ = """This Module helps implementing state machines."""
43  """The Module description"""
44
45
46  class state_machine(object):
47      """
48      :param default_state: The default state which is set on initialisation.
49      :param log_lvl: The log level, this Module logs to (see Loging-Levels of Module :mod:`logging
        `)
50
51      .. note:: Additional keyword parameters well be stored as varibles of the instance (e.g. to
        give variables or methods for transition condition calculation).
52
53      A state machine class can be created by deriving it from this class. The transitions are
        defined by overriding the variable `TRANSITIONS`.
54      This Variable is a dictionary, where the key is the start-state and the content is a tuple or
         list of transitions. Each transition is a tuple or list
55      including the following information: (condition-method (str), transition-time (number),
        target_state (str)).
56
57      .. note:: The condition-method needs to be implemented as part of the new class.
58
59      .. note:: It is usefull to define the states as variables of this class.
60
61
62      **Example:**
63
64      .. literalinclude:: state_machine/_examples_/example.py
65
66      .. literalinclude:: state_machine/_examples_/example.log
67      """
